

Actions for a safer environment:

Eliminating mosquito breeding sites

AQUÍ | NOS | CUIDAMOS

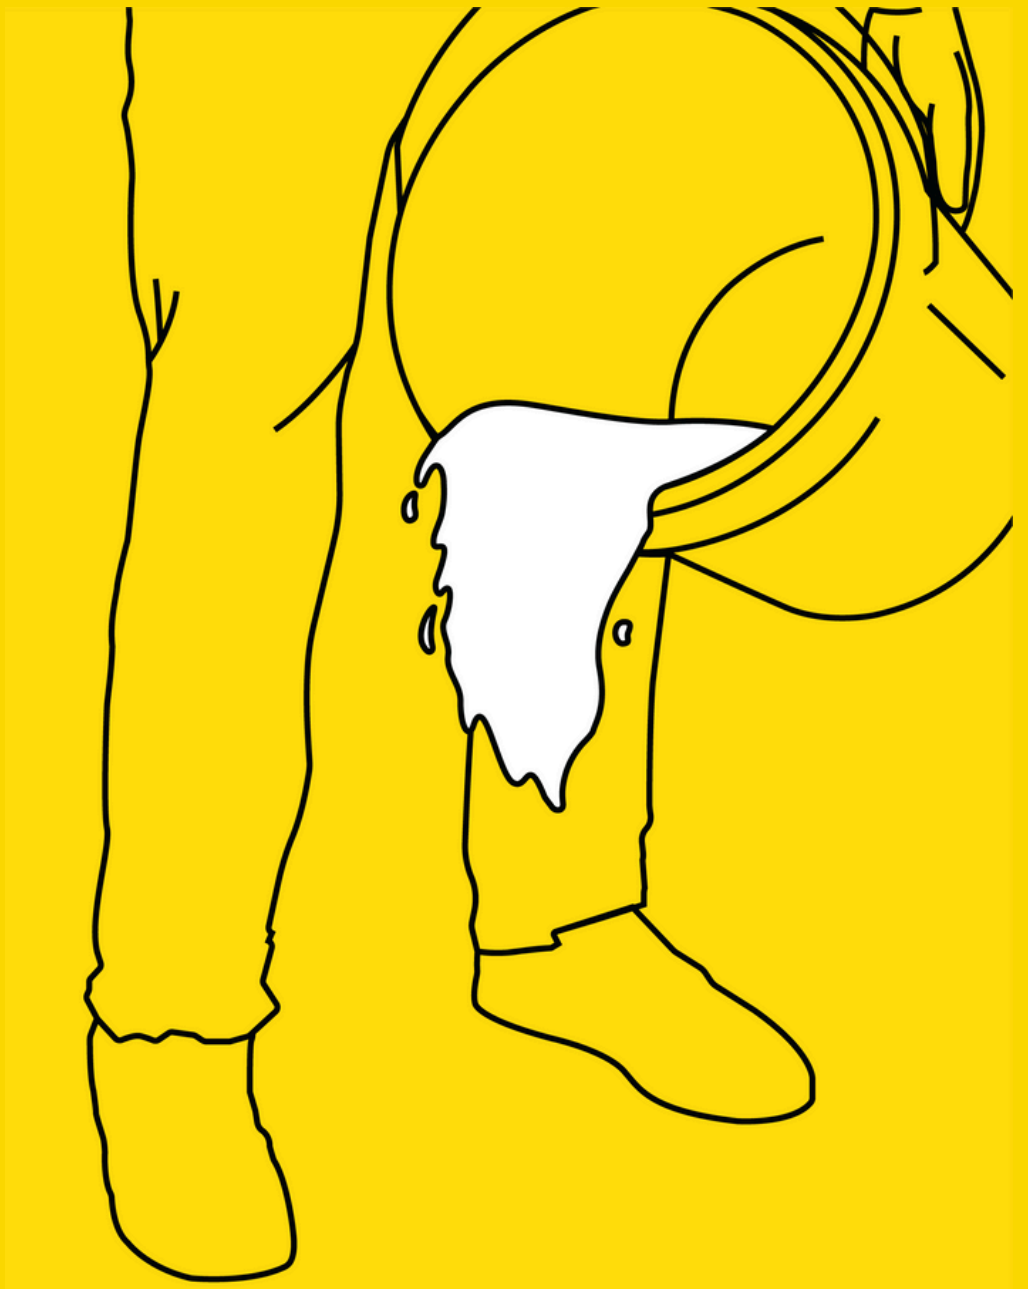

Mosquitoes can transmit diseases like dengue, Zika, and chikungunya. They need accumulated water to reproduce. To prevent these diseases transmitted by mosquitoes, eliminate containers that could become breeding sites.

Be sure to empty out, scrub, and cover any recipient that could accumulate water, inside or outside your home, and in your community. This includes tires, buckets, flowerpots, toys, swings, large bins, or trash cans, among others.

Remember, mosquitoes lay their eggs on the surface of the water accumulated inside containers. Keeping them from becoming mosquito breeding grounds can help you keep a healthier environment.
